SAVE

Flows

Description

amount, timing, and duration of freshwater flows (surface water and/or groundwater)

Very Good

Flows approximate the natural range of variability over most reaches/aerial extent most of the time

Good

Flows are moderately altered but sufficient to support native aquatic species along most reaches/aerial extent; low loss of riparian/wetland habitats due to altered flow regime

Fair

Flows are substantially altered; may not be sufficient to support native aquatic species or to maintain riparian/wetland habitats over many reaches/ aerial extent

Poor

Flows are highly altered and are insufficient to support native aquatic species and riparian/ wetland habitats over most reaches/ aerial extent
